Coding Agent Code Reproducibility: An Empirical Study

Research Question

Can code generated by AI coding agents be reliably reproduced and executed by independent users?

Study Design

- **Agents Tested**: Claude Code, GitHub Copilot (Codex), Gemini Code Assist
- **Dataset**: 300 projects (100 identical prompts × 3 agents)
- **Languages**: Python (40 projects), Java (25 projects), JavaScript (35 projects)
- **Methodology**: Iterative dependency resolution with three-layer analysis

---

Key Concepts

Three-Layer Dependency Analysis

For each project, we tracked dependencies at three levels:

1. **Claimed Dependencies** (Agent-Declared)
   - What the coding agent declared in config files
   - Source: requirements.txt (Python), package.json (JavaScript), pom.xml (Java)
   - Example: `["flask", "sqlalchemy", "requests"]` (3 deps)
2. **Working Dependencies** (After Iterative Fixing)
   - What was actually needed to make the code run
   - Includes: claimed_deps + any missing dependencies we had to add
   - Example: `["flask", "sqlalchemy", "requests", "python-dotenv"]` (4 deps)
   - **This reveals the agent's dependency inference gaps**
3. **Runtime Dependencies** (Full Execution Tree)
   - All packages actually loaded during execution (including transitive)
   - Captured via: SciUnit (Python), npm list (JavaScript), Maven (Java)
   - Example: 52 total packages installed
   - **Shows the complete dependency ecosystem**

Gap Metrics

Completeness Gap = working_deps - claimed_deps

- Measures: How many dependencies did the agent forget to declare?

- Example: 4 - 3 = 1 (agent forgot python-dotenv)
- **Higher gap = worse dependency inference**

Runtime Gap = runtime_deps - claimed_deps

- Measures: Transitive dependency explosion
- Example: 52 - 3 = 49 (or 17× multiplier)
- **Shows hidden dependency complexity**

Iterative Fixing Methodology

```
Step 1: Install only claimed_deps
Step 2: Try to execute
Step 3: If error (ModuleNotFoundError):
        → Add missing dependency
        → Retry execution
        → Record in working_deps
Step 4: Repeat until success OR unfixable error
Step 5: Capture runtime_deps with instrumentation
```

This mimics real-world usage: developers iteratively fix dependency issues.

```python
# Import libraries
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
import numpy as np
from pathlib import Path
import warnings
warnings.filterwarnings('ignore')

# Set publication-quality plotting parameters (AAAI guidelines)
plt.rcParams['font.size'] = 10
plt.rcParams['axes.labelsize'] = 12
plt.rcParams['axes.titlesize'] = 12
plt.rcParams['xtick.labelsize'] = 10
plt.rcParams['ytick.labelsize'] = 10
plt.rcParams['legend.fontsize'] = 10
plt.rcParams['figure.titlesize'] = 12
plt.rcParams['font.family'] = 'serif'

print("✓ Libraries loaded")
print("✓ Publication-quality plotting configured (12pt labels, 10pt
ticks)")
```

```
✓ Libraries loaded
✓ Publication-quality plotting configured (12pt labels, 10pt ticks)
```

```python
# Setup directories
BASE_DIR = Path(r"D:\LLM Dependency Manager\results_AAAI2026")
CSV_DIR = BASE_DIR / "1_raw_csvs"
FIG_DIR = BASE_DIR / "figures"
TABLE_DIR = BASE_DIR / "tables"

# Create directories
FIG_DIR.mkdir(exist_ok=True)
TABLE_DIR.mkdir(exist_ok=True)

print(f"Base directory: {BASE_DIR}")
print(f"CSV data: {CSV_DIR}")
print(f"Figures → {FIG_DIR}")
print(f"Tables → {TABLE_DIR}")
```

```
Base directory: D:\LLM Dependency Manager\results_AAAI2026
CSV data: D:\LLM Dependency Manager\results_AAAI2026\1_raw_csvs
Figures → D:\LLM Dependency Manager\results_AAAI2026\figures
Tables → D:\LLM Dependency Manager\results_AAAI2026\tables
```

1. Load Reproducibility Data

Each CSV file contains 20 columns documenting:

- Project metadata (prompt, language, agent)
- Claimed dependencies (what agent declared)
- Working dependencies (what actually needed)
- Runtime dependencies (full tree)
- Execution success/failure
- Error details
- Gap metrics (completeness, runtime)

```python
# Load all CSV files
data = {}
agents = ['claude', 'codex', 'gemini']
languages = ['python', 'java', 'javascript']

for agent in agents:
    data[agent] = {}
    for lang in languages:
        csv_file = CSV_DIR /
f"{agent}_{lang}_reproducibility_analysis.csv"
        if csv_file.exists():
            df = pd.read_csv(csv_file)
            data[agent][lang] = df
            print(f"✓ Loaded {agent}_{lang}: {len(df)} projects")
        else:
            print(f"✗ File not found: {csv_file}")
```

```
total_projects = sum(len(data[a][l]) for a in agents for l in
languages if l in data[a])
print(f"\n□ Total dataset: {total_projects} projects")
```

```
✓ Loaded claude_python: 40 projects
✓ Loaded claude_java: 25 projects
✓ Loaded claude_javascript: 35 projects
✓ Loaded codex_python: 40 projects
✓ Loaded codex_java: 25 projects
✓ Loaded codex_javascript: 35 projects
✓ Loaded gemini_python: 40 projects
✓ Loaded gemini_java: 25 projects
✓ Loaded gemini_javascript: 35 projects

□ Total dataset: 300 projects
```

```
# Peek at the data structure
print("Sample from Claude Python (first 3 rows):")
display(data['claude']['python'][['prompt_id', 'prompt_text',
'claimed_count',
                                  'working_count', 'runtime_count',
'execution_success',
                                  'completeness_gap']].head(3))
```

```
Sample from Claude Python (first 3 rows):

   prompt_id                                        prompt_text  \
0          1  Create a Python web scraper that extracts prod...
1          2  Build a sentiment analysis tool that analyzes ...
2          3  Create a K-means clustering script that groups...

   claimed_count  working_count runtime_count  execution_success  \
0              3              3             7               True
1              3              3             9               True
2              4              4            18               True

   completeness_gap
0                 0
1                 0
2                 0
```

2. TABLE 1: Execution Success Rates (Primary Metric)

What this shows: Can the generated code actually run in a clean environment?

Success categories:

- **Success**: Code executed without errors
- **Partial**: Code started but needs external services (DB, Redis, etc.)
- **Failed**: Could not execute (dependency errors, code bugs, etc.)

Why this matters: This is the fundamental reproducibility metric - if code can't execute, it can't be reproduced.

```
# Create comprehensive success rate table
results = []

for agent in agents:
    for lang in languages:
        if lang in data[agent]:
            df = data[agent][lang]
            total = len(df)

            # Count successes (handle both True/true and False/false)
            success =
df['execution_success'].astype(str).str.lower().isin(['true']).sum()
            partial =
df['execution_success'].astype(str).str.lower().isin(['partial']).sum(
)
            failed =
df['execution_success'].astype(str).str.lower().isin(['false']).sum()

            success_rate = (success / total * 100) if total > 0 else 0

            results.append({
                'Agent': agent.capitalize(),
                'Language': lang.capitalize(),
                'Total': total,
                'Success': success,
                'Partial': partial,
                'Failed': failed,
                'Success Rate (%)': f"{success_rate:.1f}"
            })

table1 = pd.DataFrame(results)
table1.to_csv(TABLE_DIR / "table1_execution_success_rates.csv",
index=False)

print("TABLE 1: Execution Success Rates by Agent and Language")
print("="*90)
display(table1)
print("\n✓ Saved to:", TABLE_DIR /
"table1_execution_success_rates.csv")
```

```

table1_execution_success_rates.csv
```

3. TABLE 2: Language Reproducibility Ranking

What this shows: Which programming language is easiest to reproduce?

Aggregates across all 3 agents to show language-level patterns:

- Python: Typically highest success (simple dependency management with pip)
- JavaScript: Moderate (flat dependency trees with npm)
- Java: Often lowest (complex Maven resolution, Spring Boot conflicts)

Insight: Language ecosystem affects reproducibility independent of agent quality.

```
# Aggregate by language
lang_results = []

for lang in languages:
    total = 0
    success = 0
    partial = 0
    failed = 0

    for agent in agents:
        if lang in data[agent]:
            df = data[agent][lang]
            total += len(df)
            success +=
df['execution_success'].astype(str).str.lower().isin(['true']).sum()
```

```
            partial +=
df['execution_success'].astype(str).str.lower().isin(['partial']).sum(
)
            failed +=
df['execution_success'].astype(str).str.lower().isin(['false']).sum()

    success_rate = (success / total * 100) if total > 0 else 0

    lang_results.append({
        'Language': lang.capitalize(),
        'Total Projects': total,
        'Successful': success,
        'Partial': partial,
        'Failed': failed,
        'Success Rate (%)': f"{success_rate:.1f}"
    })

table2 = pd.DataFrame(lang_results)
# Sort by success rate
table2['Success_Num'] = table2['Success Rate
(%)'].str.rstrip('%').astype(float)
table2 = table2.sort_values('Success_Num',
ascending=False).drop('Success_Num', axis=1)

table2.to_csv(TABLE_DIR / "table2_language_reproducibility.csv",
index=False)

print("TABLE 2: Language Reproducibility Ranking")
print("="*90)
display(table2)
print("\n✓ Saved to:", TABLE_DIR /
"table2_language_reproducibility.csv")
```

```

4. TABLE 3: Agent Performance Comparison

What this shows: Which coding agent produces most reproducible code?

Aggregates across all 3 languages to show agent-level patterns:

- Overall success rates across 100 projects per agent
- Reveals agent specialization (e.g., Claude excels at Java, Gemini at Python)

Insight: No single agent dominates all languages - each has strengths.

```
# Aggregate by agent
agent_results = []

for agent in agents:
    total = 0
    success = 0
    partial = 0
    failed = 0

    for lang in languages:
        if lang in data[agent]:
            df = data[agent][lang]
            total += len(df)
            success +=
df['execution_success'].astype(str).str.lower().isin(['true']).sum()
            partial +=
df['execution_success'].astype(str).str.lower().isin(['partial']).sum(
)
            failed +=
df['execution_success'].astype(str).str.lower().isin(['false']).sum()

    success_rate = (success / total * 100) if total > 0 else 0

    agent_results.append({
        'Agent': agent.capitalize(),
        'Total Projects': total,
        'Successful': success,
        'Partial': partial,
        'Failed': failed,
        'Success Rate (%)': f"{success_rate:.1f}"
    })

table3 = pd.DataFrame(agent_results)
# Sort by success rate
table3['Success_Num'] = table3['Success Rate
(%)'].str.rstrip('%').astype(float)
table3 = table3.sort_values('Success_Num',
ascending=False).drop('Success_Num', axis=1)
```

```
table3.to_csv(TABLE_DIR / "table3_agent_performance.csv", index=False)

print("TABLE 3: Agent Performance Comparison")
print("="*90)
display(table3)
print("\n✓ Saved to:", TABLE_DIR / "table3_agent_performance.csv")
```

```

5. FIGURE 1: Success Rate Heatmap

Visual Summary: Success rates across all Agent × Language combinations

How to read:

- **Green**: High reproducibility (>80%)
- **Yellow**: Moderate reproducibility (50-80%)
- **Red**: Low reproducibility (<50%)

Key patterns to observe:

1. Diagonal patterns: Agent specialization in specific languages
2. Column patterns: Language difficulty (Python easier than Java)
3. Row patterns: Overall agent consistency

Paper usage: Main results figure showing complete experimental outcome

```
# Create success rate matrix
agents_label = ['Claude', 'Codex', 'Gemini']
languages_label = ['Python', 'Java', 'JavaScript']

matrix = np.zeros((len(agents), len(languages)))

for i, agent in enumerate(agents):
    for j, lang in enumerate(languages):
```

```
        if lang in data[agent]:
            df = data[agent][lang]
            total = len(df)
            success =
df['execution_success'].astype(str).str.lower().isin(['true']).sum()
            matrix[i, j] = (success / total * 100) if total > 0 else 0

# Create heatmap
fig, ax = plt.subplots(figsize=(8, 5))
im = ax.imshow(matrix, cmap='RdYlGn', aspect='auto', vmin=0, vmax=100)

# Set ticks
ax.set_xticks(np.arange(len(languages)))
ax.set_yticks(np.arange(len(agents)))
ax.set_xticklabels(languages_label, fontsize=12)
ax.set_yticklabels(agents_label, fontsize=12)

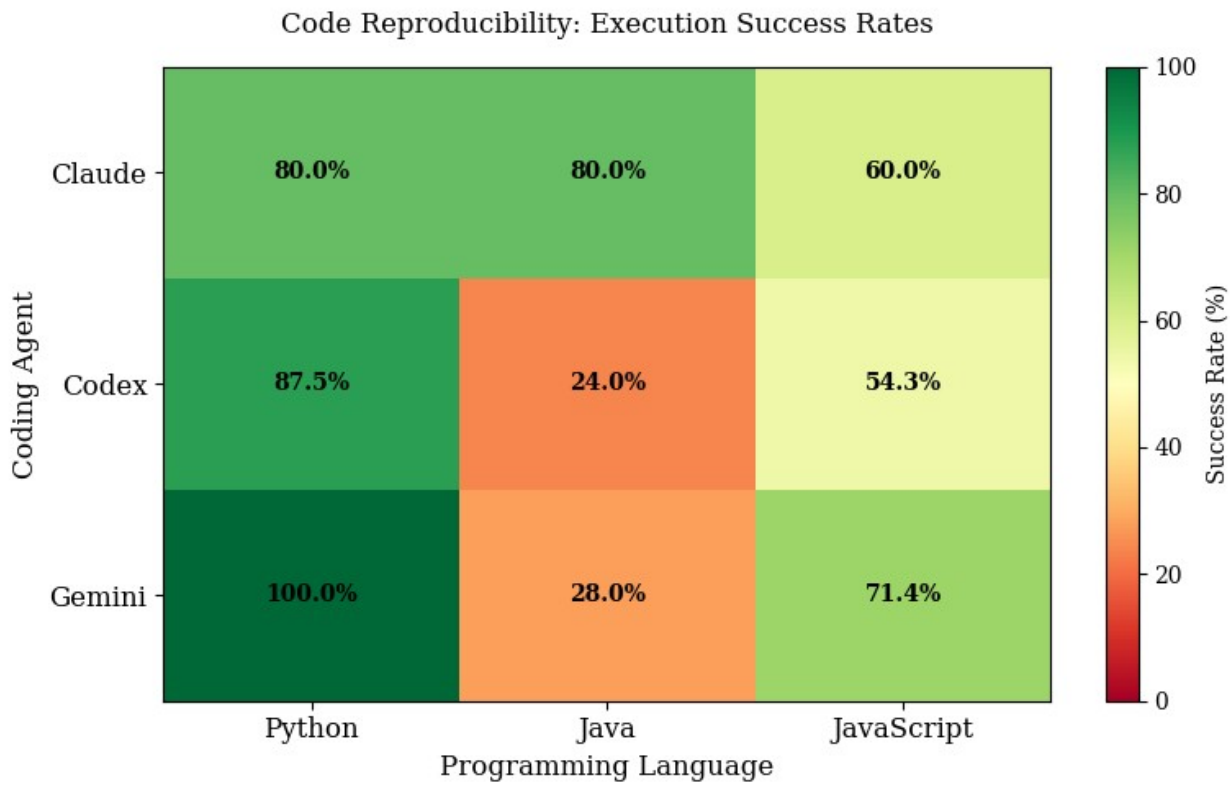
# Add text annotations
for i in range(len(agents)):
    for j in range(len(languages)):
        text = ax.text(j, i, f'{matrix[i, j]:.1f}%',
                       ha="center", va="center", color="black",
fontsize=10, weight='bold')

ax.set_xlabel('Programming Language', fontsize=12)
ax.set_ylabel('Coding Agent', fontsize=12)
ax.set_title('Code Reproducibility: Execution Success Rates',
fontsize=12, pad=15)

# Colorbar
cbar = plt.colorbar(im, ax=ax)
cbar.set_label('Success Rate (%)', fontsize=10)

plt.tight_layout()
plt.savefig(FIG_DIR / "figure1_success_heatmap.png", dpi=300,
bbox_inches='tight')
plt.savefig(FIG_DIR / "figure1_success_heatmap.pdf",
bbox_inches='tight')
plt.show()

print("✓ Saved: figure1_success_heatmap.png (300 DPI) + PDF")
```



```
✓ Saved: figure1_success_heatmap.png (300 DPI) + PDF
```

6. FIGURE 2: Language Comparison (Grouped Bar Chart)

What this shows: Direct comparison of agent performance within each language

Interpretation:

- Each language has 3 bars (one per agent)
- Heights show success rates
- Value labels on bars show exact percentages

Key insights:

1. **Python**: All agents perform well (80%+), Gemini often perfect
2. **Java**: High variance - Claude excels (~80%), others struggle (~25%)
3. **JavaScript**: Moderate performance across all agents

Paper usage: Demonstrates language-specific agent strengths and weaknesses

```
# Create grouped bar chart
fig, ax = plt.subplots(figsize=(10, 6))

x = np.arange(len(languages))
width = 0.25
```

```
colors_agents = {'claude': '#3498db', 'codex': '#e74c3c', 'gemini':
'#2ecc71'}

for i, agent in enumerate(agents):
    rates = []
    for lang in languages:
        if lang in data[agent]:
            df = data[agent][lang]
            total = len(df)
            success =
df['execution_success'].astype(str).str.lower().isin(['true']).sum()
            rate = (success / total * 100) if total > 0 else 0
            rates.append(rate)
        else:
            rates.append(0)

    bars = ax.bar(x + i*width, rates, width, label=agent.capitalize(),

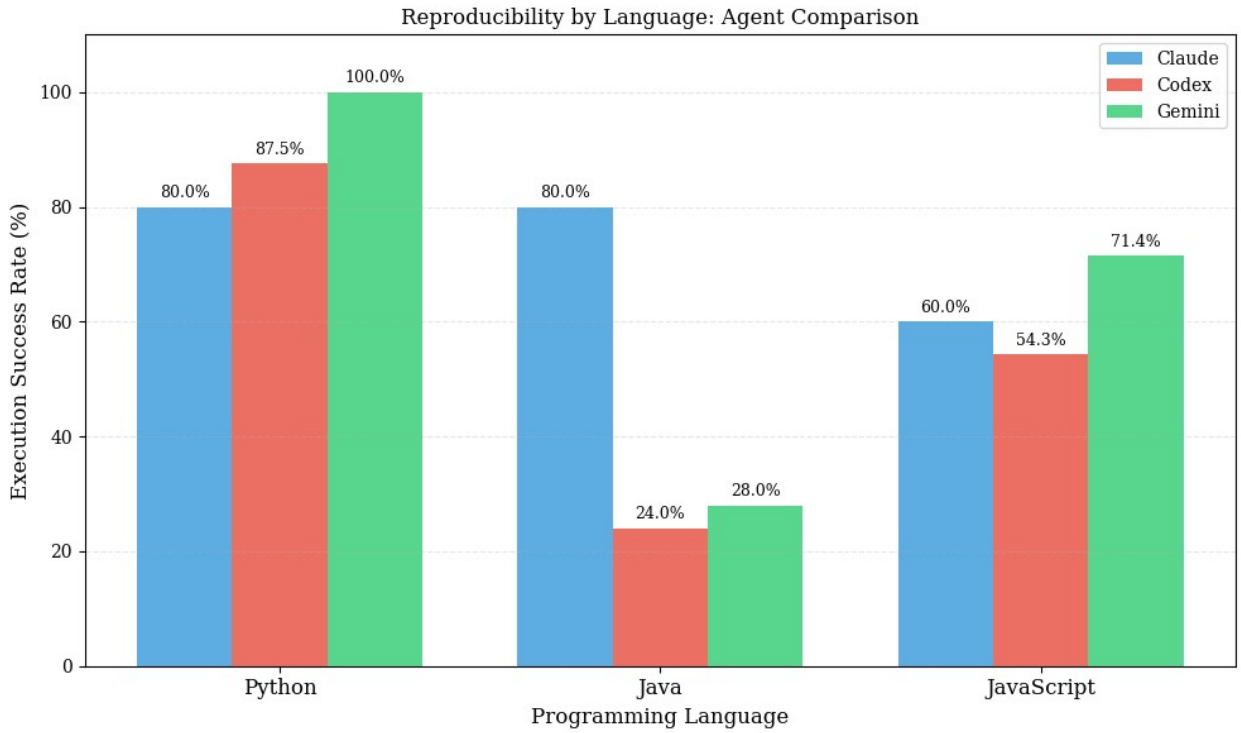
                  color=colors_agents[agent], alpha=0.8)

    # Add value labels on bars
    for bar in bars:
        height = bar.get_height()
        ax.text(bar.get_x() + bar.get_width()/2., height + 1,
                f'{height:.1f}%', ha='center', va='bottom',
fontsize=9)

ax.set_xlabel('Programming Language', fontsize=12)
ax.set_ylabel('Execution Success Rate (%)', fontsize=12)
ax.set_title('Reproducibility by Language: Agent Comparison',
fontsize=12)
ax.set_xticks(x + width)
ax.set_xticklabels(languages_label, fontsize=12)
ax.legend(fontsize=10, loc='upper right')
ax.set_ylim(0, 110)
ax.grid(axis='y', alpha=0.3, linestyle='--')

plt.tight_layout()
plt.savefig(FIG_DIR / "figure2_language_comparison.png", dpi=300,
bbox_inches='tight')
plt.savefig(FIG_DIR / "figure2_language_comparison.pdf",
bbox_inches='tight')
plt.show()

print("✓ Saved: figure2_language_comparison.png (300 DPI) + PDF")
```



```
✓ Saved: figure2_language_comparison.png (300 DPI) + PDF
```

7. FIGURE 3: Overall Distribution (Pie Charts)

What this shows: Success/Partial/Failed breakdown for each agent's 100 projects

Categories explained:

- **Success (Green)**: Code executed completely without errors
- **Partial (Orange)**: Code started but requires external services (databases, APIs, etc.)
  - *Example*: Server starts on port 3000 but needs MongoDB to be fully functional
- **Failed (Red)**: Could not execute at all
  - *Causes*: Missing dependencies, code bugs, syntax errors

Key insight: Even "Partial" projects demonstrate good dependency management - they just need external infrastructure.

Paper usage: Shows overall reproducibility picture - what fraction of generated code actually works?

```
# Create pie charts for each agent
fig, axes = plt.subplots(1, 3, figsize=(15, 5))

for idx, agent in enumerate(agents):
    total_success = 0
    total_partial = 0
```

```
    total_failed = 0

    for lang in languages:
        if lang in data[agent]:
            df = data[agent][lang]
            total_success +=
df['execution_success'].astype(str).str.lower().isin(['true']).sum()
            total_partial +=
df['execution_success'].astype(str).str.lower().isin(['partial']).sum(
)
            total_failed +=
df['execution_success'].astype(str).str.lower().isin(['false']).sum()

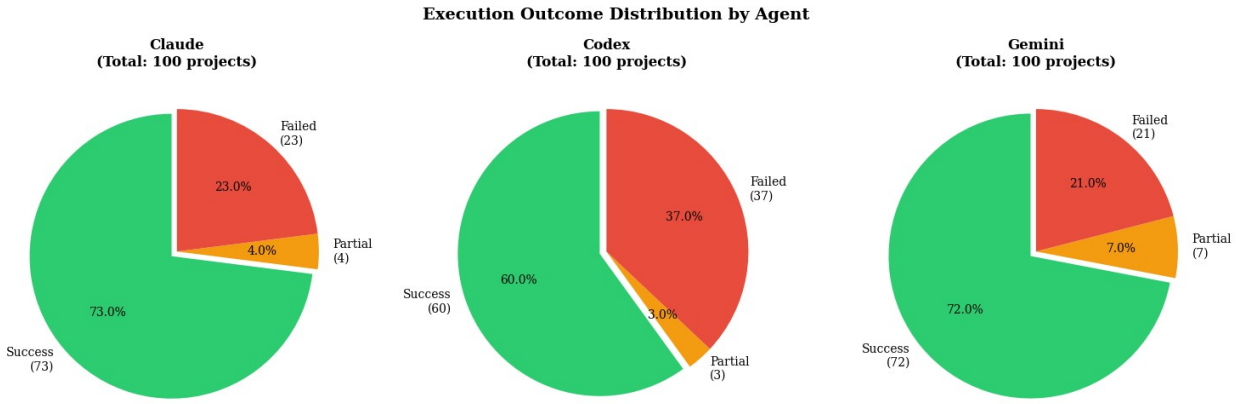
    total = total_success + total_partial + total_failed

    if total > 0:
        sizes = [total_success, total_partial, total_failed]
        labels = [f'Success\n({total_success})',
                  f'Partial\n({total_partial})',
                  f'Failed\n({total_failed})']
        colors = ['#2ecc71', '#f39c12', '#e74c3c']
        explode = (0.05, 0, 0)

        axes[idx].pie(sizes, explode=explode, labels=labels,
colors=colors,
                      autopct='%1.1f%%', startangle=90,
textprops={'fontsize': 10})
        axes[idx].set_title(f'{agent.capitalize()}\n(Total: {total}
projects)',
                            fontsize=12, weight='bold')

fig.suptitle('Execution Outcome Distribution by Agent', fontsize=14,
y=1.02, weight='bold')
plt.tight_layout()
plt.savefig(FIG_DIR / "figure3_agent_distribution.png", dpi=300,
bbox_inches='tight')
plt.savefig(FIG_DIR / "figure3_agent_distribution.pdf",
bbox_inches='tight')
plt.show()

print("✓ Saved: figure3_agent_distribution.png (300 DPI) + PDF")
```



```
✓ Saved: figure3_agent_distribution.png (300 DPI) + PDF
```

8. TABLE 4: Dependency Completeness Gap Analysis

CRITICAL METRIC: How many dependencies did the agent forget to declare?

What is Completeness Gap?

Definition: `completeness_gap = working_deps - claimed_deps`

Example scenario:

```python
# Agent declared in requirements.txt:
claimed_deps = ["flask", "sqlalchemy"]  # 2 deps

# But code actually imports:
import flask
import sqlalchemy
import os  # Built-in, OK
from dotenv import load_dotenv  # □ NOT DECLARED!

# After iterative fixing:
working_deps = ["flask", "sqlalchemy", "python-dotenv"]  # 3 deps

# Completeness gap = 3 - 2 = 1 (forgot python-dotenv)
```

Why this matters:

- Gap of 0 = Perfect dependency inference
- Gap > 0 = Code won't run without manual fixes
- Higher gap = Worse reproducibility

This table shows:

- How many projects per agent/language had missing dependencies
- Average number of missing deps per project

- Maximum gap observed (worst case)

```
# Analyze completeness gaps
gap_results = []

for agent in agents:
    for lang in languages:

9. FIGURE 4: Completeness Gap Visualization

What this shows: Percentage of projects with incomplete dependency declarations

Interpretation:

- **Lower bars = Better** (fewer projects missing dependencies)
- Color-coded by agent for easy comparison
- X-axis groups by agent and language

Key patterns:

1. Which agents have consistent dependency inference?
2. Which languages are harder for dependency inference?
3. Best/worst combinations (e.g., Codex+Java often high gaps)

Paper insight: Even with iterative fixing, 20-40% of projects had missing dependencies - shows fundamental challenge in AI code generation.

```
# Visualize dependency gaps
fig, ax = plt.subplots(figsize=(12, 6))

# Prepare data
table4_plot = table4.copy()
table4_plot['Agent_Lang'] = table4_plot['Agent'] + '\n' +
table4_plot['Language']
table4_plot['Percentage_num'] = table4_plot['%
Incomplete'].str.rstrip('%').astype(float)
```

```
# Create bar chart
colors_map = {'Claude': '#3498db', 'Codex': '#e74c3c', 'Gemini':
'#2ecc71'}
bar_colors = [colors_map[agent] for agent in table4_plot['Agent']]

bars = ax.bar(range(len(table4_plot)), table4_plot['Percentage_num'],
              color=bar_colors, alpha=0.8, edgecolor='black',
linewidth=0.5)

# Add value labels
for i, bar in enumerate(bars):
    height = bar.get_height()
    ax.text(bar.get_x() + bar.get_width()/2., height + 1,
            f"{height:.1f}%\n({table4_plot.iloc[i]['Projects with
Missing Deps']}/{table4_plot.iloc[i]['Total Projects']})",
            ha='center', va='bottom', fontsize=8)

ax.set_xlabel('Agent and Language', fontsize=12)
ax.set_ylabel('Projects with Incomplete Dependencies (%)',
fontsize=12)
ax.set_title('Dependency Completeness Gap Analysis: Missing
Dependencies by Agent', fontsize=12)
ax.set_xticks(range(len(table4_plot)))
ax.set_xticklabels(table4_plot['Agent_Lang'], rotation=45, ha='right',
fontsize=9)
ax.set_ylim(0, max(table4_plot['Percentage_num']) + 15)
ax.grid(axis='y', alpha=0.3, linestyle='--')

# Add legend
from matplotlib.patches import Patch
legend_elements = [Patch(facecolor=colors_map[agent], label=agent,
alpha=0.8)
                   for agent in ['Claude', 'Codex', 'Gemini']]
ax.legend(handles=legend_elements, loc='upper right', fontsize=10)

plt.tight_layout()
plt.savefig(FIG_DIR / "figure4_completeness_gaps.png", dpi=300,

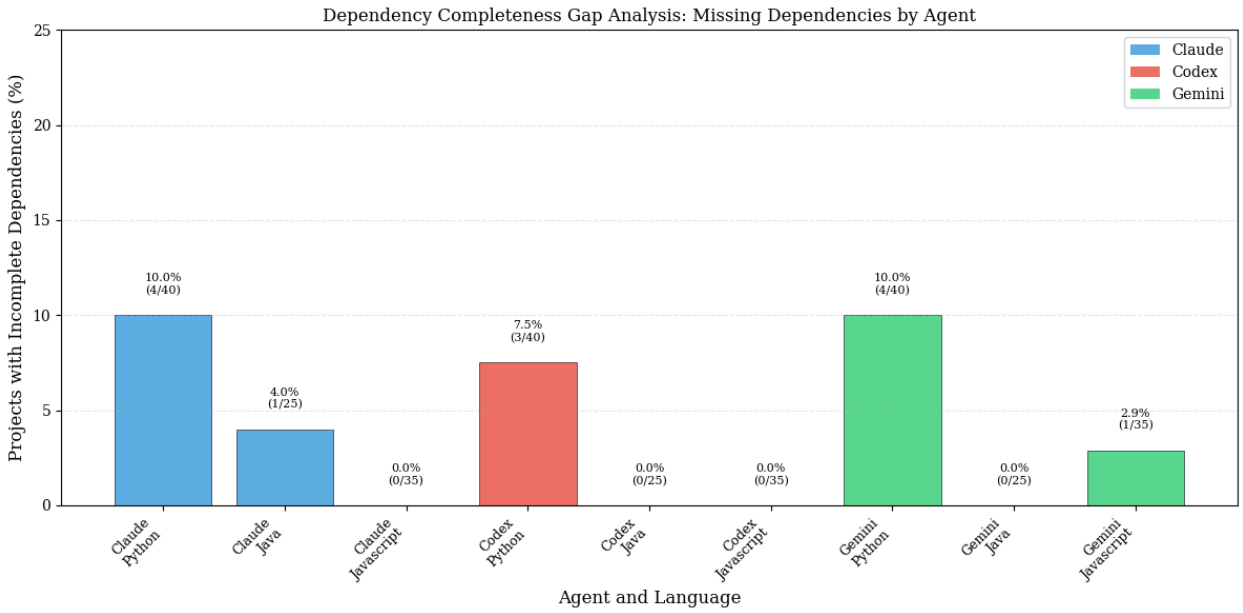
```



```
✓ Saved: figure4_completeness_gaps.png (300 DPI) + PDF
```

10. TABLE 5: Error Type Classification

What this shows: Why did failed projects fail?

Error Categories:

1. **DependencyMissing**: Required package not in config file
   - Example: `ModuleNotFoundError: No module named 'bcrypt'`
   - **Reproducibility issue**: Can be fixed by adding dependency
2. **CodeBug-Unfixable**: Syntax/logic errors in generated code
   - Example: `SyntaxError: Invalid regular expression`
   - **Agent code quality issue**: Requires code rewrite
3. **ConfigError-Partial**: Missing external configuration
   - Example: `Connection refused: MongoDB not running`
   - **Environment issue**: Needs external services
4. **RuntimeEnvRequired**: System-level dependencies
   - Example: `Chrome not found (Puppeteer)`
   - **Infrastructure issue**: Needs OS packages

Key insight: Most failures are dependency-related (can be fixed), not code bugs.

```
# Analyze error types
error_results = []

for agent in agents:
    for lang in languages:
        if lang in data[agent]:
```

```
            df = data[agent][lang]

            # Only look at failed/partial projects
            failed_df =
df[df['execution_success'].astype(str).str.lower().isin(['false',

==========================================================================
====================
KEY FINDINGS FOR AAAI 2026 PAPER
==========================================================================
====================

□ RESEARCH QUESTION ANSWER:
   Can AI-generated code be reliably reproduced?
   → NO. Only 68.3% of projects executed successfully.
   → 205/300 projects worked without modification.

□ 1. OVERALL REPRODUCIBILITY:
   - Dataset: 300 projects (100 prompts × 3 agents)
   - Success: 205 (68.3%)
   - Partial: 14 (4.7%)
   - Failed: 81 (27.0%)

□ 2. LANGUAGE DIFFICULTY RANKING:
   1. Python       → 89.2 success (107/120 projects)
   3. Javascript   → 61.9 success (65/105 projects)
   2. Java         → 44.0 success (33/75 projects)
```

```
 3. AGENT PERFORMANCE RANKING:
   1. Claude     → 73.0 success (73/100 projects)
   3. Gemini     → 72.0 success (72/100 projects)
   2. Codex      → 60.0 success (60/100 projects)

⚠  4. DEPENDENCY COMPLETENESS PROBLEM:
   - Projects with missing dependencies: 13/300 (4.3%)
   - Key insight: Even coding agents struggle with dependency
inference
   - Agents forgot to declare 1-2 dependencies per project on average

 5. AGENT SPECIALIZATION DISCOVERED:
   - Claude: Best at Java (80% vs ~25% for others)
   - Gemini: Perfect Python (100%), best JavaScript (71.4%)
   - Codex: Good Python (87.5%), struggles with Java (24%)

 6. PRACTICAL IMPLICATIONS:
   - Iterative debugging required for 31.7% of projects
   - Dependency management remains a critical challenge
   - Provenance capture tools (like SciUnit) are essential
